

Yes. Since this is the **first version containing auto-update**, build and install one new installer now. After that, future versions can update through GitHub Releases automatically.

For your **Attendance Desktop** project, open PowerShell/Terminal in the project folder and run these commands.

1. Go to your project

PowerShell

```
cd "D:\OneDrive\App Dev\Attendance desktop"
```

If your project is already open in Antigravity/VS Code terminal, you can skip this.

2. Install dependencies

PowerShell

```
npm install
```

3. Check the current version

PowerShell

```
npm pkg get version
```

For example, if it shows:

```
"1.0.2"
```

change it to `1.0.3`:

PowerShell

```
npm version 1.0.3 --no-git-tag-version
```

4. Build the application

First try:

PowerShell

```
npm run build
```

Then create the Windows installer:

PowerShell

```
npm run dist
```

If your `package.json` uses `electron-builder` but does not have a `dist` command, use:

PowerShell

```
npx electron-builder --win
```

After it finishes, look in folders such as:

```
dist\  
release\  
out\
```

You should see something similar to:

```
Attendance.Desktop.Setup.1.0.3.exe
```

5. Test this installer first

Install the new `.exe` on your computer. Open Attendance Desktop and confirm that version `1.0.3` works normally.

Then make another small test release such as `1.0.4`. This is how you confirm auto-update actually works.

PowerShell

```
npm version 1.0.4 --no-git-tag-version  
npm run build  
npm run dist
```

6. Commit the new version to GitHub

PowerShell

```
git add .  
git commit -m "Release v1.0.4"  
git push origin main
```

Important: auto-update requires GitHub Release publishing

Simply running:

PowerShell

```
git push
```

does **not automatically mean the desktop updater has an update available**. The new installer/update files need to be published to a GitHub Release.

If your Electron Builder GitHub publishing is already configured, you can publish directly using:

PowerShell

```
npx electron-builder --win --publish always
```

You will normally need a GitHub token available to Electron Builder:

PowerShell

```
$env:GH_TOKEN="YOUR_GITHUB_TOKEN"  
npx electron-builder --win --publish always
```

Do **not** put the GitHub token directly inside your source code or commit it to GitHub.

Recommended future workflow

Once the first auto-update-enabled installer is installed, your normal release process can be:

PowerShell

```
npm version patch --no-git-tag-version  
npm run build  
npx electron-builder --win --publish always  
git add .  
git commit -m "Publish new Attendance Desktop version"  
git push origin main
```

`npm version patch` automatically changes versions like:

```
1.0.3 → 1.0.4  
1.0.4 → 1.0.5
```

The key point is that **existing users don't need to manually reinstall each version**, but **you still need to build and publish each new desktop version**.

If you paste your `package.json` here, I can give you the **exact terminal commands for your Attendance Desktop project**, including the correct `npm run ...` command and GitHub auto-release command.
